

Enhanced Delta Smelt Monitoring

Preliminary Abundance Analysis

DRAFT

U.S. Fish and Wildlife Service

March 24, 2017

This analysis is preliminary and the results are subject to correction and revision. The following points should be taken into consideration when interpreting the results:

1. Delta smelt caught in the wings of the net (as opposed to the live box or cod end) were excluded from this analysis. Fish caught in the wings are indicated by a Gear Condition Code of 9.
2. Abundance estimates labeled **Total** exclude any strata that were not sampled in a given week.
3. The **Week** designations used here were defined out of convenience and are subject to change.
4. Enhanced delta smelt monitoring for adults is limited to mid-channel sampling by Kodiak trawl gear. Trawl gears may not accurately index the population if a large fraction is distributed in shallow waters. Sampling locations are restricted to areas of the delta with a depth of at least 8 feet at mean tide. The abundance estimation method assumes that the density in unsampleable areas (i.e., those with depth less than 8 feet) is the same as in sampleable areas.
5. The methods of analysis used here remain in development.

Update Log

January 14, 2017

- Different abundance estimation methods were applied to Weeks 1 – 3 and Week 4 because of model convergence issues.

January 20, 2017

- A new optimization method was used to estimate abundance estimates and overcome the issues in the last report. The updated method was applied to Weeks 1 - 5 and resulted in changes to past abundance estimates, particularly in Week 4. The updated method will be used in future reports unless otherwise noted.

January 27, 2017

- The method used to calculate confidence intervals in Table 2 was updated.
- Maps of average delta smelt catch densities by site were added.
- An abundance time series figure was added.
- An update log was added to reflect major changes made to this report between weeks.

February 3, 2017

- Sampling was cut short by fog and high winds, resulting in fewer sites in the "High Risk, Low Density" stratum than originally scheduled.

February 10, 2017 (End of Week 8)

- Previous reports incorrectly indicated that a total of 6 sites were visited in the "High Risk, Low Density" stratum during Week 4. The correct total is 7.
- Corrections to sample volumes have resulted in minor changes to abundance estimates from previous weeks.

February 17, 2017 (End of Week 9)

- Tables 3 and 4 were added.
- A minor correction was made to the confidence interval calculations for proportions.
- Sampling in the eastern portion of the "Low Risk, Low Density" stratum was limited due to flooding.

February 24, 2017 (End of Week 10)

- There is a discrepancy in the Week 8 abundance estimates relative to previous reports. The cause is unknown.

March 3, 2017 (End of Week 11)

- The Week 8 issue from the last report was resolved. An incorrect number of maximum possible tows was being used in the low density strata calculations (10 was being used when it should have been 8). The reports from Weeks 8 and 9 used the incorrect value.

March 10, 2017 (End of Week 12)

- The EDSM caught only 4 delta smelt between 3/6 and 3/9. Low catches suggest either a very large, unlikely mortality event or, more likely, that the adult population has redistributed into shallow waters where they are unavailable to Kodiak trawl gear.

March 17, 2017 (End of Week 13)

- Results from past weeks have changed as a result of corrections to the database. The model results are sensitive to changes in input data, indicating that further refinements are needed.

March 24, 2017 (End of Week 14)

- Sampling was impacted by weather on Tuesday 3/21. Make-up sampling is scheduled for Friday 3/24.

Table 1: Abundance estimates by week. *No delta smelt were caught.

Week	Dates	Stratum	Num of Sites	Estimate and 95% CI		
				Abundance	Lower Bound	Upper Bound

Tables 2 - 4 show various proportion estimates. In the captions HH, HL, LH, and LL are used to represent the "High Risk, High Density", "High Risk, Low Density", "Low Risk, High Density", and "Low Risk, Low Density" strata respectively, and \hat{n}_{HH} , \hat{n}_{HL} , \hat{n}_{LH} , and \hat{n}_{LL} are used to represent abundance estimates in the indicated strata.

Table 2: Proportion of delta smelt in high density areas that are also in high risk areas, $\hat{p}_{HH} = \frac{\hat{n}_{HH}}{\hat{n}_{HH} + \hat{n}_{LH}}$, and proportion in high density areas that are also in low risk areas, $\hat{p}_{LH} = \frac{\hat{n}_{LH}}{\hat{n}_{HH} + \hat{n}_{LH}}$.
